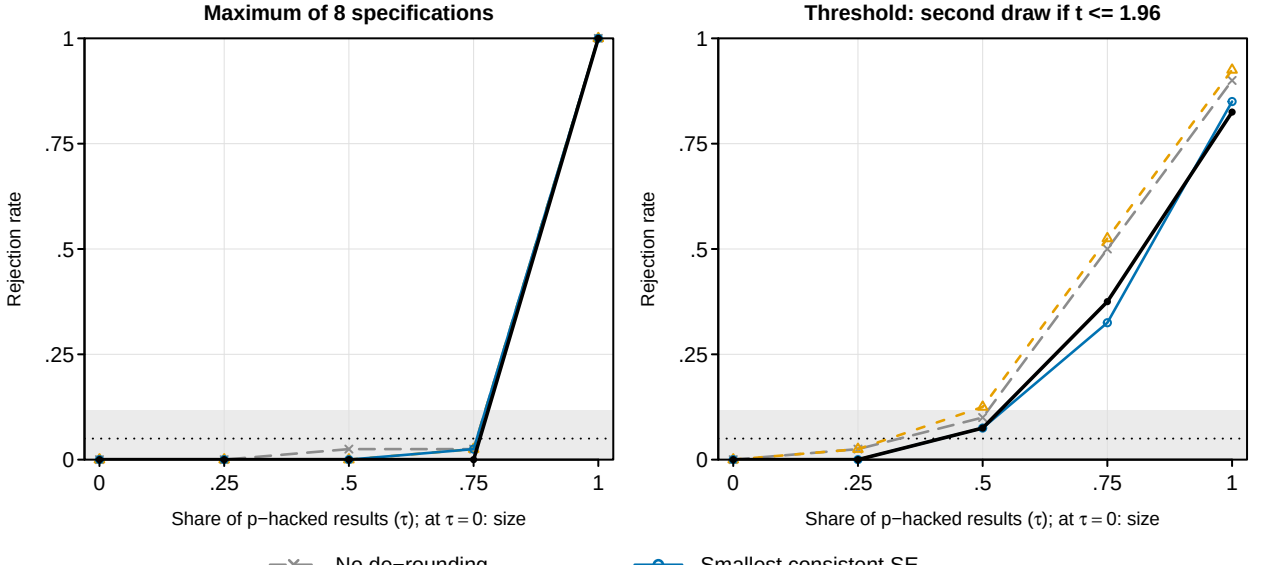
Projection test


Brodeur et al. (2020), all four methods pooled, kappa <= 0.5: 19,811 t−statistics in 675 articles; 40 repetitions; shaded: 95% band around 5%.
Effects ~ Gamma(shape 1.413, rate 0.770), i.e. scale 1.298 and mean 1.83, Kudrin's, with 1.2980 a scale; within−article rho = 0.80 (in the effects).
Under s_min and s_min + noise the projection test rejects only if B−hat > rounding allowance 0.13 x mean(kappa^6) = 2.4e−04; otherwise if p <= 0.05.
